

European EV Market Intelligence & Business Strategy

Market Prioritization, Competition & Revenue Scenarios - Student Case Study

Aster Mobility Systems GmbH is fictional. All market values, companies, shares and revenue scenarios are synthetic.

8 markets	EUR 3.17B 2026 addressable market	4 Tier-1 markets	United Kingdom top-ranked market
--------------	--	---------------------	---

Project objective

I built this project to practice how a market-intelligence or business-development analyst could compare several attractive countries without simply choosing the largest market. The analysis combines market size, growth, EV adoption, charging infrastructure, commercial ease and competition.

Country prioritization

The weighted model identifies 4 Tier-1 markets: United Kingdom, Germany, France, Netherlands. I treat the score as a discussion tool rather than a precise prediction because the weights and synthetic assumptions can be challenged.

Country Attractiveness & Market Prioritization

Competition and customer focus

I created a fictional competitor benchmark to practice positioning analysis without presenting invented numbers about real companies. The highest-scoring customer segment in the model is Vehicle OEMs.

Competitor Benchmark

All competitor names and shares are fictional

Commercial scenarios

The Base scenario across the four priority markets gives approximately EUR 17.3 million of Year-3 revenue potential. This is not a forecast; it is a sensitivity exercise based on accessible-market and capture-rate assumptions.

Commercial Scenario Analysis

€5.9M

Conservative Year 3

€17.3M

Base Year 3

€40.6M

Upside Year 3

Base-case assumptions

25% of market treated as accessible

1.8% target capture rate

1.70x Year-3 multiplier

This is a planning sensitivity,
not a company revenue forecast.

Student takeaway

The biggest lesson for me was that market size and strategic priority are not the same thing. A smaller market can be attractive because it is easier to access, less competitive or better suited to an early pilot. I also learned that a strategy model becomes more useful when the assumptions are visible enough for someone else to challenge.

This is an educational portfolio case study, not a real market forecast or consulting engagement.
